

# CSC 551: Web Programming

Spring 2004

## client-side programming with JavaScript

- scripts vs. programs
  - JavaScript vs. JScript vs. VBScript
  - common tasks for client-side scripts
- JavaScript
  - data types & expressions
  - control statements
  - functions & libraries
  - strings & arrays
  - Date, document, navigator, user-defined classes

1

## Client-side programming

recall: HTML is good for developing *static* pages

- can specify text/image layout, presentation, links, ...
- Web page looks the same each time it is accessed
- in order to develop interactive/reactive pages, must integrate programming

## client-side programming

- programs are written in a separate programming language
  - e.g., JavaScript, JScript, VBScript
- programs are embedded in the HTML of a Web page, with tags to identify the program component
  - e.g., `<script type="text/javascript"> ... </script>`
- the browser executes the program as it loads the page, integrating the dynamic output of the program with the static content of HTML

2

## Scripts vs. programs

a scripting language is a simple, interpreted programming language

- scripts are embedded as plain text, interpreted by application
- *simpler execution model*: don't need compiler or development environment
- *saves bandwidth*: source code is downloaded, not compiled executable
- *platform-independence*: code interpreted by any script-enabled browser
- *but*: slower than compiled code, not as powerful/full-featured

**JavaScript**: the first Web scripting language, developed by Netscape in 1995

syntactic similarities to Java/C++, but simpler & more flexible  
(loose typing, dynamic variables, simple objects)

**JScript**: Microsoft version of JavaScript, introduced in 1996

same core language, but some browser-specific differences  
fortunately, IE & Netscape can (mostly) handle both JavaScript & JScript

*JavaScript 1.5 & JScript 5.0 cores conform to ECMAScript standard*

**VBScript**: client-side scripting version of Microsoft Visual Basic

3

## Common scripting tasks

adding dynamic features to Web pages

- validation of form data
- image rollovers
- time-sensitive or random page elements
- handling cookies

defining programs with Web interfaces

- utilize buttons, text boxes, clickable images, prompts, frames

limitations of client-side scripting

- since script code is embedded in the page, viewable to the world
- for security reasons, scripts are limited in what they can do
  - e.g., *can't access the client's hard drive*
- since designed to run on any machine platform, scripts do not contain platform specific commands
- script languages are not full-featured
  - e.g., *JavaScript objects are crude, not good for large project development*

4

## JavaScript

JavaScript code can be embedded in a Web page using SCRIPT tags

- the output of JavaScript code is displayed as if directly entered in HTML

```
<html>
<!-- Dave Reed js01.html 2/01/04 -->

<head>
  <title>JavaScript Page</title>
</head>

<body>
  <script type="text/javascript">
    // silly code to demonstrate output

    document.write("Hello world!");

    document.write("<p>How are <br />" +
                  "<i>you</i>?</p>");
  </script>

  <p>Here is some static text as well.
  </p>
</body>
</html>
```

[view page in browser](#)

document.write displays text in page

text to be displayed can include HTML tags

the tags are interpreted by the browser when the text is displayed

as in C++/Java, statements end with ;

JavaScript comments similar to C++/Java

// starts a single line comment

/\* ... \*/ enclose multi-line comments

5

## JavaScript data types & variables

JavaScript has only three primitive data types

```
strings : "foo"  'howdy do'      "I said 'hi'."      ""
numbers: 12      3.14159        1.5E6
booleans: true   false
```

```
<html>
<!-- Dave Reed js02.html 2/01/04 -->

<head>
  <title>Data Types and Variables</title>
</head>

<body>
  <script type="text/javascript">
    x = 1024;
    document.write("<p>x = " + x + "</p>");

    x = "foobar";
    document.write("<p>x = " + x + "</p>");
  </script>
</body>
</html>
```

[view page in browser](#)

assignments are as in C++/Java

```
message = "howdy";
pi = 3.14159;
```

variable names are sequences of letters, digits, and underscores: *start with a letter*

variables names are case-sensitive

*you don't have to declare variables, will be created the first time used*

*variables are loosely typed, can assign different types of values*

6

## JavaScript operators & control statements

```
<html>
<!-- Dave Reed js03.html 2/01/04 -->

<head>
    <title>Folding Puzzle</title>
</head>

<body>
    <script type="text/javascript">
        distanceToSun = 93.3e6*5280*12;
        thickness = .002;

        foldCount = 0;
        while (thickness < distanceToSun) {
            thickness *= 2;
            foldCount++;
        }
        document.write("Number of folds = " +
                      foldCount);
    </script>
</body>
</html>
```

[view page in browser](#)

standard C++/Java operators & control statements are provided in JavaScript

- +, -, \*, /, %, ++, --, ...
- ==, !=, <, >, <=, >=
- &&, ||, !
- if, if-else, while, do, ...

PUZZLE: Suppose you took a piece of paper and folded it in half, then in half again, and so on.

How many folds before the thickness of the paper reaches from the earth to the sun?

7

## JavaScript Math routines

```
<html>
<!-- Dave Reed js04.html 2/01/04 -->

<head>
    <title>Random Dice Rolls</title>
</head>

<body>
    <div style="text-align:center">
        <script type="text/javascript">
            roll1 = Math.floor(Math.random()*6) + 1;
            roll2 = Math.floor(Math.random()*6) + 1;

            document.write("<img src='http://www.creighton.edu/" +
                           "~davereed/csc551/Images/die" +
                           roll1 + ".gif' />");
            document.write("&nbsp;&nbsp;");
            document.write("<img src='http://www.creighton.edu/" +
                           "~davereed/csc551/Images/die" +
                           roll2 + ".gif' />");

        </script>
    </div>
</body>
</html>
```

[view page in browser](#)

the Math object contains functions and constants

Math.sqrt  
Math.pow  
Math.abs  
Math.max  
Math.min  
Math.floor  
Math.ceil  
Math.round

Math.PI  
Math.E

Math.random  
function returns number in [0..1]

8

## Interactive pages using prompt

```
<html>
<!-- Dave Reed js05.html 2/01/04 -->

<head>
    <title>Interactive page</title>
</head>

<body>
    <script type="text/javascript">
        userName = prompt("What is your name?", "");

        userAge = prompt("Your age?", "");
        userAge = parseFloat(userAge);

        document.write("Hello " + userName + ".")
        if (userAge < 18) {
            document.write(" Do your parents know " +
                "you are online?");
        }
    </script>

    <p>The rest of the page...
</body>
</html>
```

[view page in browser](#)

crude user interaction can take place using prompt

1<sup>st</sup> argument: the prompt message that appears in the dialog box

2<sup>nd</sup> argument: a default value that will appear in the box (in case the user enters nothing)

the function returns the value entered by the user in the dialog box (a string)

if value is a number, must use parseFloat to convert

forms will provide a better interface for interaction (later)

9

## User-defined functions

function definitions are similar to C++/Java, except:

- no return type for the function (since variables are loosely typed)
- no types for parameters (since variables are loosely typed)
- by-value parameter passing only (parameter gets copy of argument)

```
function isPrime(n)
// Assumes: n > 0
// Returns: true if n is prime, else false
{
    if (n < 2) {
        return false;
    }
    else if (n == 2) {
        return true;
    }
    else {
        for (var i = 2; i <= Math.sqrt(n); i++) {
            if (n % i == 0) {
                return false;
            }
        }
        return true;
    }
}
```

can limit variable scope

if the first use of a variable is preceded with var, then that variable is local to the function

for modularity, should make all variables in a function local

10

## Function example

```
<html>
<!-- Dave Reed js06.html 2/01/04 -->

<head>
    <title>Prime Tester</title>

    <script type="text/javascript">
        function isPrime(n)
            // Assumes: n > 0
            // Returns: true if n is prime
        {
            // CODE AS SHOWN ON PREVIOUS SLIDE
        }
    </script>
</head>

<body>
    <script type="text/javascript">
        testNum = parseFloat(prompt("Enter a positive integer", "7"));

        if (isPrime(testNum)) {
            document.write(testNum + " <b>is</b> a prime number.");
        }
        else {
            document.write(testNum + " <b>is not</b> a prime number.");
        }
    </script>
</body>
</html>
```

function definitions go in the HEAD

HEAD is loaded first, so the function is defined before code in the BODY is executed

[view page in browser](#)

11

## Another example

```
<html>
<!-- Dave Reed js07.html 2/01/04 -->

<head>
    <title> Random Dice Rolls Revisited</title>

    <script type="text/javascript">
        function RandomInt(low, high)
            // Assumes: low <= high
            // Returns: random integer in range [low..high]
        {
            return Math.floor(Math.random() * (high-low+1)) + low;
        }
    </script>
</head>

<body>
    <div align="center">
        <script type="text/javascript">
            roll1 = RandomInt(1, 6);
            roll2 = RandomInt(1, 6);

            document.write("<img src='http://www.creighton.edu/" +
                "~davereed/csc551/Images/die" +
                roll1 + ".gif' />");
            document.write("&nbsp;&nbsp;");
            document.write("<img src='http://www.creighton.edu/" +
                "~davereed/csc551/Images/die" +
                roll2 + ".gif' />");
        </script>
    </div>
</body>
</html>
```

recall the dynamic dice page

could define a function for generating random numbers in a range, then use whenever needed

easier to remember, promotes reuse

[view page in browser](#)

12

## JavaScript libraries

better still: if you define functions that may be useful to many pages, store in a separate library file and load the library when needed

the file at

<http://www.creighton.edu/~davereed/csc551/JavaScript/random.js>  
contains definitions of the following functions:

RandomNum(low, high)	returns random real in range [low..high)
RandomInt(low, high)	returns random integer in range [low..high)
RandomChar(string)	returns random character from the string
RandomOneOf([item1,...,itemN])	returns random item from list/array

*Note: as with external style sheets, no tags in the JavaScript library file*

load a library using the SRC attribute in the SCRIPT tag (nothing between the tags)

```
<script type="text/javascript"
       src="http://www.creighton.edu/~davereed/csc551/JavaScript/random.js">
</script>
```

13

## Library example

```
<html>
<!-- Dave Reed js08.html 2/01/04 -->

<head>
    <title> Random Dice Rolls Revisited</title>
    <script type="text/javascript"
           src="http://www.creighton.edu/~davereed/csc551/JavaScript/random.js">
    </script>
</head>

<body>
    <div align="center">
        <script type="text/javascript">
            roll1 = RandomInt(1, 6);
            roll2 = RandomInt(1, 6);

            document.write("<img src='http://www.creighton.edu/" +
                          "~davereed/csc551/Images/die" +
                          roll1 + ".gif' />");
            document.write("&nbsp;&nbsp;");
            document.write("<img src='http://www.creighton.edu/" +
                          "~davereed/csc551/Images/die" +
                          roll2 + ".gif' />");

        </script>
    </div>
</body>
</html>
```

[view page in browser](#)

14

## JavaScript Strings

a class defines a new type (formally, *Abstract Data Type*)

- encapsulates data (properties) and operations on that data (methods)

a String encapsulates a sequence of characters, enclosed in quotes

properties include

length : stores the number of characters in the string

methods include

charAt(index) : returns the character stored at the given index  
(as in C++/Java, indices start at 0)

substring(start, end) : returns the part of the string between the start  
(inclusive) and end (exclusive) indices

toUpperCase() : returns copy of string with letters uppercase

toLowerCase() : returns copy of string with letters lowercase

to create a string, assign using `new` or just make a direct assignment (`new` is implicit)

`word = new String("foo");`      `word = "foo";`

properties/methods are called exactly as in C++/Java

`word.length`

`word.charAt(0)`

15

## String example: palindromes

```
function Strip(str)
// Assumes: str is a string
// Returns: str with all but letters removed
{
    var copy = "";
    for (var i = 0; i < str.length; i++) {
        if ((str.charAt(i) >= "A" && str.charAt(i) <= "Z") ||
            (str.charAt(i) >= "a" && str.charAt(i) <= "z")) {
            copy += str.charAt(i);
        }
    }
    return copy;
}

function IsPalindrome(str)
// Assumes: str is a string
// Returns: true if str is a palindrome, else false
{
    str = Strip(str.toUpperCase());

    for(var i = 0; i < Math.floor(str.length/2); i++) {
        if (str.charAt(i) != str.charAt(str.length-i-1)) {
            return false;
        }
    }
    return true;
}
```

suppose we want to  
test whether a word  
or phrase is a  
palindrome

noon      Radar  
Madam, I'm Adam.  
A man, a plan, a canal:  
Panama!

must strip non-letters out of the  
word or phrase

make all chars uppercase  
in order to be case-insensitive

finally, traverse and compare  
chars from each end

16

```

<html>
<!-- Dave Reed js09.html 2/01/04 -->

<head>
<title>Palindrome Checker</title>

<script type="text/javascript">
    function Strip(str)
    {
        // CODE AS SHOWN ON PREVIOUS SLIDE
    }

    function IsPalindrome(str)
    {
        // CODE AS SHOWN ON PREVIOUS SLIDE
    }
</script>
</head>

<body>
<script type="text/javascript">
    text = prompt("Enter a word or phrase", "Madam, I'm Adam");

    if (IsPalindrome(text)) {
        document.write("'" + text + "' <b>is</b> a palindrome.");
    }
    else {
        document.write("'" + text + "' <b>is not</b> a palindrome.");
    }
</script>
</body>
</html>

```

[view page in browser](#)

17

## JavaScript arrays

arrays store a sequence of items, accessible via an index  
*since JavaScript is loosely typed, elements do not have to be the same type*

- to create an array, allocate space using `new` (or can assign directly)

```

items = new Array(10);      // allocates space for 10 items
items = new Array();        // if no size, will adjust dynamically
items = [0,0,0,0,0,0,0,0,0,0]; // can assign size & values []

```

- to access an array element, use `[]` (as in C++/Java)

```

for (i = 0; i < 10; i++) {
    items[i] = 0;                  // stores 0 at each index
}

```

- the `length` property stores the number of items in the array

```

for (i = 0; i < items.length; i++) {
    document.write(items[i] + "<br>"); // displays elements
}

```

18

```

<html>
<!-- Dave Reed js10.html 2/01/04 -->

<head>
<title>Die Statistics</title>

<script type="text/javascript"
src="http://www.creighton.edu/~davereed/csc551/JavaScript/random.js">
</script>
</head>

<body>
<script type="text/javascript">
numRolls = 60000;
dieSides = 6;

rolls = new Array(dieSides+1);
for (i = 1; i < rolls.length; i++) {
    rolls[i] = 0;
}

for(i = 1; i <= numRolls; i++) {
    rolls[RandomInt(1, dieSides)]++;
}

for (i = 1; i < rolls.length; i++) {
    document.write("Number of " + i + "'s = " +
                    rolls[i] + "<br />");
}
</script>
</body>
</html>

```

## Array example

suppose we want to  
simulate die rolls and  
verify even distribution

keep an array of counters:

initialize each count to 0

each time you roll x,  
increment rolls[X]

display each counter

[view page in browser](#)

19

## Date class

String & Array are the most commonly used classes in JavaScript

- other, special purpose classes & objects also exist

the Date class can be used to access the date and time

- to create a Date object, use new & supply year/month/day/... as desired

```

today = new Date();           // sets to current date & time
newYear = new Date(2002,0,1); //sets to Jan 1, 2002 12:00AM

```

- methods include:

```

newYear.getYear()
newYear.getMonth()
newYear.getDay()
newYear.getHours()
newYear.getMinutes()
newYear.getSeconds()
newYear.getMilliseconds()

```

can access individual components of a date

20

```

<html>
<!-- Dave Reed js11.html 2/01/04 -->

<head>
    <title>Time page</title>
</head>

<body>
    Time when page was loaded:
    <script type="text/javascript">
        now = new Date();

        document.write("<p>" + now + "</p>");

        time = "AM";
        hours = now.getHours();
        if (hours > 12) {
            hours -= 12;
            time = "PM"
        }
        else if (hours == 0) {
            hours = 12;
        }
        document.write("<p>" + hours + ":" +
                      now.getMinutes() + ":" +
                      now.getSeconds() + " " +
                      time + "</p>");

    </script>
</body>
</html>

```

## Date example

by default, a date will be displayed in full, e.g.,

Sun Feb 03 22:55:20 GMT-0600  
(Central Standard Time) 2002

can pull out portions of the date using the methods and display as desired

here, determine if "AM" or "PM" and adjust so hour between 1-12

10:55:20 PM

[view page in browser](#)

21

```

<html>
<!-- Dave Reed js12.html 2/01/04 -->

<head>
    <title>Time page</title>
</head>

<body>
    This year:
    <script type="text/javascript">
        now = new Date();
        newYr = new Date(2004,0,1);

        secs = Math.round((now-newYr)/1000);

        days = Math.floor(secs / 86400);
        secs -= days*86400;
        hours = Math.floor(secs / 3600);
        secs -= hours*3600;
        minutes = Math.floor(secs / 60);
        secs -= minutes*60

        document.write(days + " days, " +
                      hours + " hours, " +
                      minutes + " minutes, and " +
                      secs + " seconds.");
    </script>
</body>
</html>

```

## Another example

you can add and subtract Dates:  
the result is a number of milliseconds

here, determine the number of seconds since New Year's day

divide into number of days, hours, minutes and seconds

*possible improvements?*

[view page in browser](#)

22

## document object

Both IE and Netscape allow you to access information about an HTML document using the `document` object (*Note: not a class!*)

```
<html>
<!-- Dave Reed js13.html 2/01/04 -->

<head>
  <title>Documentation page</title>
</head>

<body>
  <table width="100%">
    <tr>
      <td><small><i>
        <script type="text/javascript">
          document.write(document.URL);
        </script>
      </i></small></td>
      <td align="right"><small><i>
        <script type="text/javascript">
          document.write(document.lastModified);
        </script>
      </i></small></td>
    </tr>
  </table>
</body>
</html>
```

`document.write(...)`  
method that displays text in  
the page

`document.URL`  
property that gives the  
location of the HTML  
document

`document.lastModified`  
property that gives the date &  
time the HTML document was  
saved

[view page in browser](#)

23

## navigator object

`navigator.appName`  
property that gives the browser  
name

`navigator.appVersion`  
property that gives the browser  
version

```
<!-- MSIE.css -->

a {text-decoration:none;
  font-size:larger;
  color:red;
  font-family:Arial}
a:hover {color:blue}

<!-- Netscape.css -->

a {font-family:Arial;
  color:white;
  background-color:red}
```

```
<html>
<!-- Dave Reed js14.html 2/01/04 -->

<head>
  <title>Dynamic Style Page</title>

  <script type="text/javascript">
    if (navigator.appName == "Netscape") {
      document.write('<link rel=stylesheet ' +
        'type="text/css" href="Netscape.css">');
    }
    else {
      document.write('<link rel=stylesheet ' +
        'type="text/css" href="MSIE.css">');
    }
  </script>
</head>

## User-defined classes

can define new classes, but the notation is awkward

- simply define a function that serves as a constructor
- specify data fields & methods using `this`
- no data hiding: can't protect data or methods

```
// Dave Reed      Die.js      2/01/04
//
// Die class definition
///////////////////////////////
function Die(sides)
{
    this.numSides = sides;
    this.numRolls = 0;
    this.Roll = Roll;
}

function Roll()
{
    this.numRolls++;
    return Math.floor(Math.random()*this.numSides) + 1;
}
```

define `Die` function (i.e., constructor)

initialize data fields in the function, preceded with `this`

similarly, assign method to separately defined function (which uses `this` to access data)

25

```
<html>
<!-- Dave Reed  js15.html  2/01/04 -->

<head>
    <title>Dice page</title>

    <script type="text/javascript"
           src="Die.js">
    </script>
</head>

<body>
    <script type="text/javascript">
        die6 = new Die(6);
        die8 = new Die(8);

        roll6 = -1;      // dummy value to start loop
        roll8 = -2;      // dummy value to start loop
        while (roll6 != roll8) {
            roll6 = die6.Roll();
            roll8 = die8.Roll();

            document.write("6-sided: " + roll6 +
                           " &ampnbsp&ampnbsp" +
                           "8-sided: " + roll8 + "<br />");
        }

        document.write("<br />Number of rolls: " +
                      die6.numRolls);
    </script>
</body>
</html>
```

## Class example

create a `Die` object using `new` (similar to `String` and `Array`)

here, the argument to `Die` initializes `numSides` for that particular object

each `Die` object has its own properties (`numSides` & `numRolls`)

`Roll()`, when called on a particular `Die`, accesses its `numSides` property and updates its `NumRolls`
